

Airtable: Care Department Blueprint

Objective: Define the Airtable structure, pipeline requirements, and data integration points necessary to run the EDU Passport Care & Service operations effectively.

1. Overview of the Care Department's Airtable Scope

As the Care Department, our primary responsibility within Airtable is to manage the customer lifecycle, support ticketing, upsell opportunities, and protect our platform ecosystem by intercepting external "Triggered Leads."

To do this efficiently without building a massive system overnight, we are focusing on two main operational categories:

- 1. **Care & Service Pipeline:** Handling active user issues, tracking ticket statuses, and funneling happy users toward account management for upsells.
- 2. **Triggered Lead Intervention:** Catching external job, deal, and event posts, scrubbing the contact info, and cross-referencing our database to see if they are an existing user.

2. Core Tables & Field Requirements (What Data We Need)

To minimize development load for Phase 1, we have categorized our data fields by their origin: **Platform Sync** (requiring tech team assistance), **Scraped Data** (from our data collection nets), and **Manual Entry** (handled by Care agents).

Table A: Contacts (The Foundation)

This table stores all individuals interacting with EDU Passport. We need a mix of live platform data and manual outreach logging.

Field Name	Field Type	Data Origin	Notes / Logic
Contact ID	Autonumber / Unique ID	Platform Sync	Matches the user ID on EDU Passport admin panel to prevent duplication.
Full Name	Single Line Text	Mixed	Manual for targeted, auto for synced users.
User Type	Single Select	Platform Sync	Options: Educator, Business, Vendor.
Platform Status	Single Select	Platform Sync	Options: Active User,

Field Name	Field Type	Data Origin	Notes / Logic
			Inactive, Non-User (Lead).
Email Address	Email	Mixed	Unique key used to match and sync bi-directionally with Brevo.
WeChat ID	Single Line Text	Manual / Scraped	Crucial handle for the care/growth outreach funnels.
WhatsApp	Phone Number	Manual / Scraped	Crucial handle for the care/growth outreach funnels.

Table B: Tickets & Care Pipeline

This table acts as our helpdesk and service operations center, managed primarily by the Care Manager and Care Agents.

Field Name	Field Type	Data Origin	Notes / Logic
Ticket ID	Autonumber	Auto-generated	Unique reference number for tracking support tickets.
Associated Contact	Link to Contacts	Manual	Connects the ticket directly to the central profile in the Contacts table.
Issue Type	Single Select	Manual	Options: Technical Bug, Account Access, Profile Verification, Billing, Feature Request, General Inquiry.
Ticket Priority	Single Select	Manual	Options: Low, Medium, High, Urgent.
Ticket Status	Single Select	Manual	Options: New, In Progress, Awaiting User Reply, Resolved.

Field Name	Field Type	Data Origin	Notes / Logic
Upsell Potential	Checkbox	Manual	Flagged by care agents when a user shows interest in premium features. Automatically triggers a view for Account Management (AM).

Table C: Scraped Feeds (The Triggered Nets)

This is where the Care team interfaces with external market data to protect our platform and capture new business.

Field Name	Field Type	Data Origin	Notes / Logic
Post Type	Single Select	Scraped Data	Options: Job Post, Deal Post, Event Post.
Source URL	URL	Scraped Data	Direct link to where the external post was found.
Raw Contact Info	Long Text	Scraped Data	Uncleaned text block captured from the external source containing potential handles/emails.
Cleaned Email	Email	Manual	The finalized, scrubbed email contact processed by the care agent.
Repeat Poster Flag	Formula / Rollup	Airtable Logic	An automated formula that flags if an email or business has posted multiple times to track "repeat offenders."

Field Name	Field Type	Data Origin	Notes / Logic
Existing User Cross-Check	Link / Lookup	Airtable Logic	CRITICAL: Automatically checks if the scrubbed email already exists in our active platform user database. If it matches, alerts Care to send an EDU Inbox message.

3. Automation & Data Flows Requested

To make this lightweight CRM operational, the Care Department requests the technical implementation of three primary data flows:

1. **Inbound Sync (Platform → Airtable):** Automatically push newly registered users and their profile attributes (User Type, Status) from the EDU Admin Panel into the Airtable Contacts table daily.
2. **Outbound Sync (Airtable → Platform / EDU Inbox):** When the *Existing User Cross-Check* in the Scraped Feeds table returns a match, we need a trigger that allows Care to easily push an automated or manual prompt to their **EDU Inbox** advising them to use internal platform posting tools.
3. **Marketing Automation Loop (Airtable ↔ Brevo):** Syncing contact status changes between Airtable and Brevo so that when a lead changes status, they are immediately funneled into the correct automated email workflow.

4. Care Department Access & Permissions Control

- **Care Department Lead & Care Agents:** Full edit and creation access to the *Tickets* and *Scraped Feeds* tables. Full access to create/update *Contacts*.
- **Growth Team / Account Management Collaboration:** View-only access to the *Sales Pipeline* so Care agents can see if a contact is already actively being sold to before addressing a support ticket or initiating a care-led upsell.
